

POWER FFC (4-pin from APM): +5V +3V3 GND GND (-5V made on-board)

- POWER INPUT
 - 4-pin FFC from APM (+5V)
 - ICL7660 makes -5V

OUTPUTS - 1/4in L/R (ACJS-MHOM) + 3.5mm headphone/debug

AUDIO INPUT

- U.FL for L and R DACs from APM

ANALOG PATH – each channel's buffer output (FILT_x_IN) goes into the analog sub-sheet; FILT_x_OUT returns to the jacks

MASTER VOLUME - RV4/RV5 = one dual-gang pot (shared L/R knob); attenuates final output to the jacks/HP

FX CHAIN - ¹DRIVE (soft clip) + ²TREMOLO (OTA VCA, LFO=CV_FX1); each bypassable (FX_EN). In: ³FILT_x_FILT (from SVF) -> ⁴Out: ⁵FX_x_OUT (to volume)

DECODING 100nF/IC

log FX ~ simulate/verify diode clip levels and OTA VCA vs LM13700 datasheet

NOTE: analog FX – simulate/verify diode clip levels and OTA VCA vs LM13700 datasheet before fab.

ANALOG FILTER / CV (stereo) – SPI in (10-pin FFC) -> DAC8565 makes CVs -> per-channel LM13700 VCF/VCA; CD4053 selects analog or FPGA-digital

CONTROL/DAC – one 10-pin control FFC (root) feeds this DAC (CS_DAC1) + the FX DAC + MCP over ONE shared SPI bus; MODE_SEL from the expander

TOGGLE – CD4053: MODE_SEL selects analog (VCA_x_OUT) vs bypass (FILT_x_IN) for BOTH L and R

CV SUMMER – DAC CV_CUTOFF + CV_MOD summed by U5 -> VCUTOFF (drives both L and R VCFs); knob lives on the control board

VCF+VCA L – LM13700 OTA lowpass then OTA VCA (NOTE: OTA/labc topology – verify vs datasheet)

VCF+VCA R – LM13700 OTA lowpass then OTA VCA (NOTE: OTA/labc topology – verify vs datasheet)

FILT_x_IN / FILT_x_OUT are the hierarchical pins shared with the root (front-end) sheet. Power rails (+5V/-5V/GND) are global.

FX CHORUS (true stereo) - BBD (MN3207) delay per channel, MN3101 2-phase clock swept by CV_FX3 (vibrato); wet/dry mix; bypass CD4053 on FX_EN3.

Anti-alias LPF in, reconstruction LPF out. NOTE: NO NE570 compander (not in KiCad libs) - add later for lower BBD noise. VDD=+5V (verify BBD headroom/bias + clock rate vs datasheet + real-model sim before fab).
